The Landesentwicklungsgesellschaft Thüringen and the Innovationszentrum BAU cordially invite you to the workshop

Recycling and Reconstruction

Building Methods and Materials for Syria
after the War

At least two million buildings in Syria have been partially or completely destroyed during the bitter war. Landfill capacities are limited and the CO₂ emissions released from the use of new building materials are of great significant.

Professor Dr. Aref al-Swaidani, a renowned expert in construction material recycling, sees great opportunities for Syria's sustainable reconstruction through the networking of industry and knowledge exchange on circular economy, recycling facilities and the processing of secondary raw materials.

This workshop aims to promote exchange and collaboration between science and industry to develop effective ecological, practical and above all, economic approaches for Syria's sustainable reconstruction.

We look forward to your active participation and an inspiring dialogue!
